

El Paso County Economic & Workforce Progress Report (EPR)

Highlights - January 2024

Happy New Year to you! I am excited to start the new year with some positive reporting on the U.S. economy, which I've lately heard referred to as the "Teflon" economy. But before I jump in there is a February 26th event I'd like to share that is real estate specific. Oakwood and Banning Lewis have become DDES sponsors, and they have graciously opened the event to any realtor who wants a short economic update focusing on the current and upcoming real estate market. Please contact karole@madwomanms.com (or 719-649-3987) to register.

To start, **Gross Domestic Product {Page 3}**, or GDP, for 2023 Q4 was just released, and it showed that year-over-year, the U.S. economy grew 3.1%. If we annualize the Q4 economic activity, the economy grew by 3.3%. Growth over the quarter was attributable to (once again) personal consumption expenditures (+2.8%), investment spending (+1.7%), government spending (+3.3%), and exports (+6.3%), which outstripped imports (+1.9%). The increase in net exports was the positive "surprise" element of the GDP data.

Many of the indicators that have been flashing "recession alert" for the past 1-2 years, are still in recession-likely territory, but those indices are retreating. For example, the LEI, or Leading Economic Indicator from the Conference Board has been below the recession threshold for 22 consecutive months with an average over Q4 of -0.7%. However, in December it had the smallest decline (0.1%) since March 2022 when the Fed began interest rate hikes. The LEI improvements emanated from stock market gains, low unemployment claims, positive building permits, and slowly easing credit conditions for borrowers (due to the expectation that the Fed will ease rates this year). Other indices that feed into the LEI were still negative such as manufacturing new orders, but I would say that if the LEI continues to be "less bad," it may confirm the soft landing (e.g., no recession) scenario. Now, the implications of a stronger-than-expected economy mean that interest rate cuts may be fewer than some experts thought (I've always thought six cuts in 2024 was unrealistic). Now many experts are saying that most developed economies (the "G10") will cut 25 basis points (0.25%) once a quarter starting in late spring or early summer. The latest Fed meeting indicates those decision makers are leaning towards three 0.25% cuts (total 0.75%) during 2024, and they are the decision makers. I pay closer attention to their statements, alongside the incoming data.

But an earlier rate cut is not out of the question because of the progress on inflation. "Headline" **Inflation {Page 3}** is still above the Fed's 2% target, and it actually increased from November to December from 3.1% to 3.4%. Stripping out food and energy ("core inflation") stayed about the same. However, the Fed uses a slightly different measure for inflation called the PCE deflator, and it was lower in 2023 Q4 at 3.2% compared to Q4 of last year. The core PCE deflator without food and energy was amazingly at the Fed target (2.0%) if that Q4 measure is annualized. It may seem like splitting hairs, but that core PCE deflator is what the Fed uses for decision making so it's a big deal, and that's why a March rate cut may happen, although I'd be surprised. Many of you work in interest-rate sensitive industries so I will say that a May rate cut is the most likely scenario as long as there are no surprises in the data and/or geopolitical shocks that impact our economy.

The resiliency is remarkable considering the Fed has hiked 525 basis points since March 2022, and the rest-of-the-world economy isn't in great shape. There is a plethora of reasons for the resiliency, but I believe it largely has to do with the relative self-sufficiency of the U.S. economy. We produce a lot of the goods and services our residents need and want, including energy and agricultural goods. Another major factor is that consumers keep buying those goods (feeding the virtuous business/household economic cycle) because people have jobs as I've often stated. The **Unemployment Rates {Page 3}** for the U.S. (3.5%), Colorado (3.2%), and El Paso County (3.3%) all stayed exactly the same at historically very low levels between November and December. Despite headlines of mostly tech and some financial institutions that are cutting jobs, the relative shortage of workers is advantageous for the average worker – and their confidence has made them particularly optimistic about income expectations. This is much of what has fueled continued consumerism with some [consumers who are over-extended](#). As that two-minute segment shows, consumer borrowing is at record highs, and I am hoping in 2024 that overstretched consumers begin to pay down debt even if they are optimistic about those [income expectations](#), which I discussed in a subsequent segment.

By the way, those rosy income expectations are the main reason that **Consumer Sentiment {Page 3}** had a significant increase from 69.7 in December to 78.8 as discussed in that segment. Moderating price increases also helped those favorable outlooks.

Speaking of expectations, there is a positive momentum that comes from low unemployment, persistent consumerism, and impending interest rate cuts. New home sales in the U.S. jumped in December (+8.0%) after a roughly similar decline in November. It may seem like a wash but lower mortgage rates (6.7% as of January 25th), high inventory, and falling new home prices all helped some consumers who were on the fence jump in and buy a new home. I believe this momentum will continue because interest rates will only go down from here, excess inventory (at 8.2 months' supply) will take time to dwindle down, and many builders are still offering concessions. In fact, median new home sale prices in the U.S. fell 3.0% in December to \$413,200, and over the course of 2023, new home prices were down 13.8% (although to be fair, square footage of the average new

home fell by 100 sq. ft. in 2023).

The trend to buy new homes due to low existing home inventory remains fully intact as evidenced by (new) home buyer surveys. In December, new home sales were up 4.4% year-over-year while existing single-family home sales were *down* 6.1%. The dearth of existing single-family homes had prices in 2023 *up* by 4.0%. Existing home prices historically have been lower than new home prices, but the current supply distortions fomented over the past 15 years, have turned that upside down. Estimates are that the “premium” to buy a new home (compared to a similar existing home) is only \$26,000. That’s easily one significant repair in an older home. I’m feeling pretty smug right now about our 2019 home build.

The affordability crunch that’s resulted from years of underbuilding in the U.S. continues to also be the case locally. Pikes Peak **Building Permits {Page 6}** show the final numbers for 2023 at a total of 5,033 single and multi-family permits – well short of the roughly 8,500 that are needed to close the supply gap and accommodate new residents. As that graph shows, a large portion of the 2023 local residential building was multi-family. Although it’s true that locally we have an overall shortage of housing, I do wonder what will happen when 30-year rates fall below 6%, spring/summer hits, and more single-family buyers enter the market. Many of those individuals are renters now and as the **Apartment Rental Information {Page 6}** shows, Colorado Springs, Denver and Salt Lake City all have “soft” markets right now with vacancies between 8-11%. Lease rates have come down a little in those markets, but not much. As more first-time buyers enter the market later this year, some of those apartments will be taken by people who are now doubling up or staying with family. However, the multi-family market may suffer a bit with the 2024 rate cuts and continued increase in local, new (multi-family) product.

Despite all my talk of a sturdy economy that defies expectations, I do want to mention one other risk besides consumer debt levels. The militant attacks on container and other cargo ships in the Red Sea pose a geopolitical threat in an already volatile part of the world, and they pose a threat to global supply chains and inflation. The Red Sea and Suez Canal host 12% of total global trade and roughly 30% of container trade flows. One of the largest global shipping giants, Maersk, suspended all operations in the Red Sea this past week. The chart shows how shipping costs have suddenly jumped. But that visual also shows that these increases are so far impacting prices at about half the order of magnitude compared to the pandemic-related supply disruptions. Mind you, since the beginning of this month, the shipping cost increases are logarithmic and should they continue at that pace, the world economy will acutely feel it, especially Europe and other countries closer to the Red Sea. In the U.S., however, business inventory levels are higher now than they were in 2021/2022, and consumer demand, while still hot, is not at the levels when stimulus checks, and pent-up demand were pervasive. I will caution, however, that as of last week, shipping companies are reporting 12-20 additional days to ship items, with (as an example) a 400% increase in shipping costs from Shanghai to Italy and about a 200% increase from Shanghai to LA. I can only imagine how insurance companies are responding, which will further add to the costs of shipping. Once again, the ability of the U.S. to produce a lot of what it consumes, such as energy, is also helping us. Energy consumption in the U.S. began levelling off in 2005, and U.S. energy production has been increasing. This has led to an energy trade surplus enabling the U.S. to be a net energy exporter for the past three years.

There are global, positive externalities to the outperformance of the U.S. economy. The U.S. makes up 4.5% of the world population but contributes about 11% to global GDP. Our economy is big enough and trades enough with allies that the strength of the U.S. economy will enable the Euro Area and U.K. to recover from their (likely) recessions more quickly. Mexico and Canada, our biggest trade partners, will also benefit as the U.S. represents 70% of the end destination of goods for both of those countries (combined). And when other countries do well, they buy more U.S. exports fueling business growth in the U.S. It’s positive momentum, and I hope it keeps up. For all reasons stated above, most economic thinktanks have revised up their 2024 **Forecasts for U.S. GDP {Page 3}** (to rates between 1.2% to 1.7% depending on the source) and global GDP growth (lower than trend growth but still positive at 2.7%).

Speaking of positive momentum, my whole family (and every Maize and Blue human on the planet) is feeling euphoric about the Natty (e.g., College Football National Championship). I’ll let the visual speak for itself. For those of you who don’t know, the previous tagline was “Michigan Against Everybody.” With the departure of the head coach and many key players, things will be challenging moving forward. But for now, the sweet aroma of victory swirls around me.

Tatiana & Rebecca

2022 Federal Poverty Level (FPL)

	El Paso County	U.S.
% people at FPL or below	8.3%	12.6%

Note: FPL in 2022 was \$18,310 for an individual and \$27,750 for a family of four.

2022-23 Minimum Wage & Living Wage El Paso County

	Wage/Hr	Annualized
Minimum wage salary for full-time worker	\$13.65	\$28,392
Living wage: HHs with 1 adult, 2 children	\$49.16	\$102,253
Living wage: HHs with 2 adults (1 working), 2 children	\$41.02	\$85,322
Living wage: HHs with 2 adults* (2 working), 2 children	\$26.74	\$55,619

*Living wage is for each working adult. For specifics, go to livingwage.mit.edu.

2023 Q2 Average Annual Wages for All Industries

El Paso County wages are 9.4% lower than U.S. wages and 15.3% lower than CO wages.

U.S.	Colorado	El Paso County
\$69,264	\$74,100	\$62,764

2023 Q2 El Paso County Total Employment (excluding military)

307,098

***Estimated military employment in 2021 (and % of total 2021 EPC who are military).**

61,489 (17.4%)

*QCEW data does not include military-related employees. Military employment includes USAFA, Schriever, Fort Carson, Peterson & Cheyenne Mountain. Data from the installations is delayed so this is still 2021 employment.

Sources: National Highway Safety Administration; Colorado Department of Transportation; World Bank; U.S. Census Bureau; Colorado State Demography Offices; Data-Driven Economic Strategies

Note: "Each year when Crime in the United States is published, some entities use reported figures to compile rankings of cities and counties. These rough rankings provide no insight into the numerous variables that mold crime in a particular town, city, county, state, or region. Consequently, they lead to simplistic and/or incomplete analyses that often create misleading perceptions adversely affecting communities and their residents. Valid assessments are possible only with careful study and analysis of the range of unique conditions affecting each local law enforcement jurisdiction. The data user is, therefore, cautioned against comparing statistical data of individual reporting units from cities, metropolitan areas, states, or colleges or universities solely on the basis of their population coverage or student enrollment."
